StudyGPT

AI-powered study planner: personalised study schedules from exam dates, subjects and available time

github.com/26z216-stack/Study-GPT

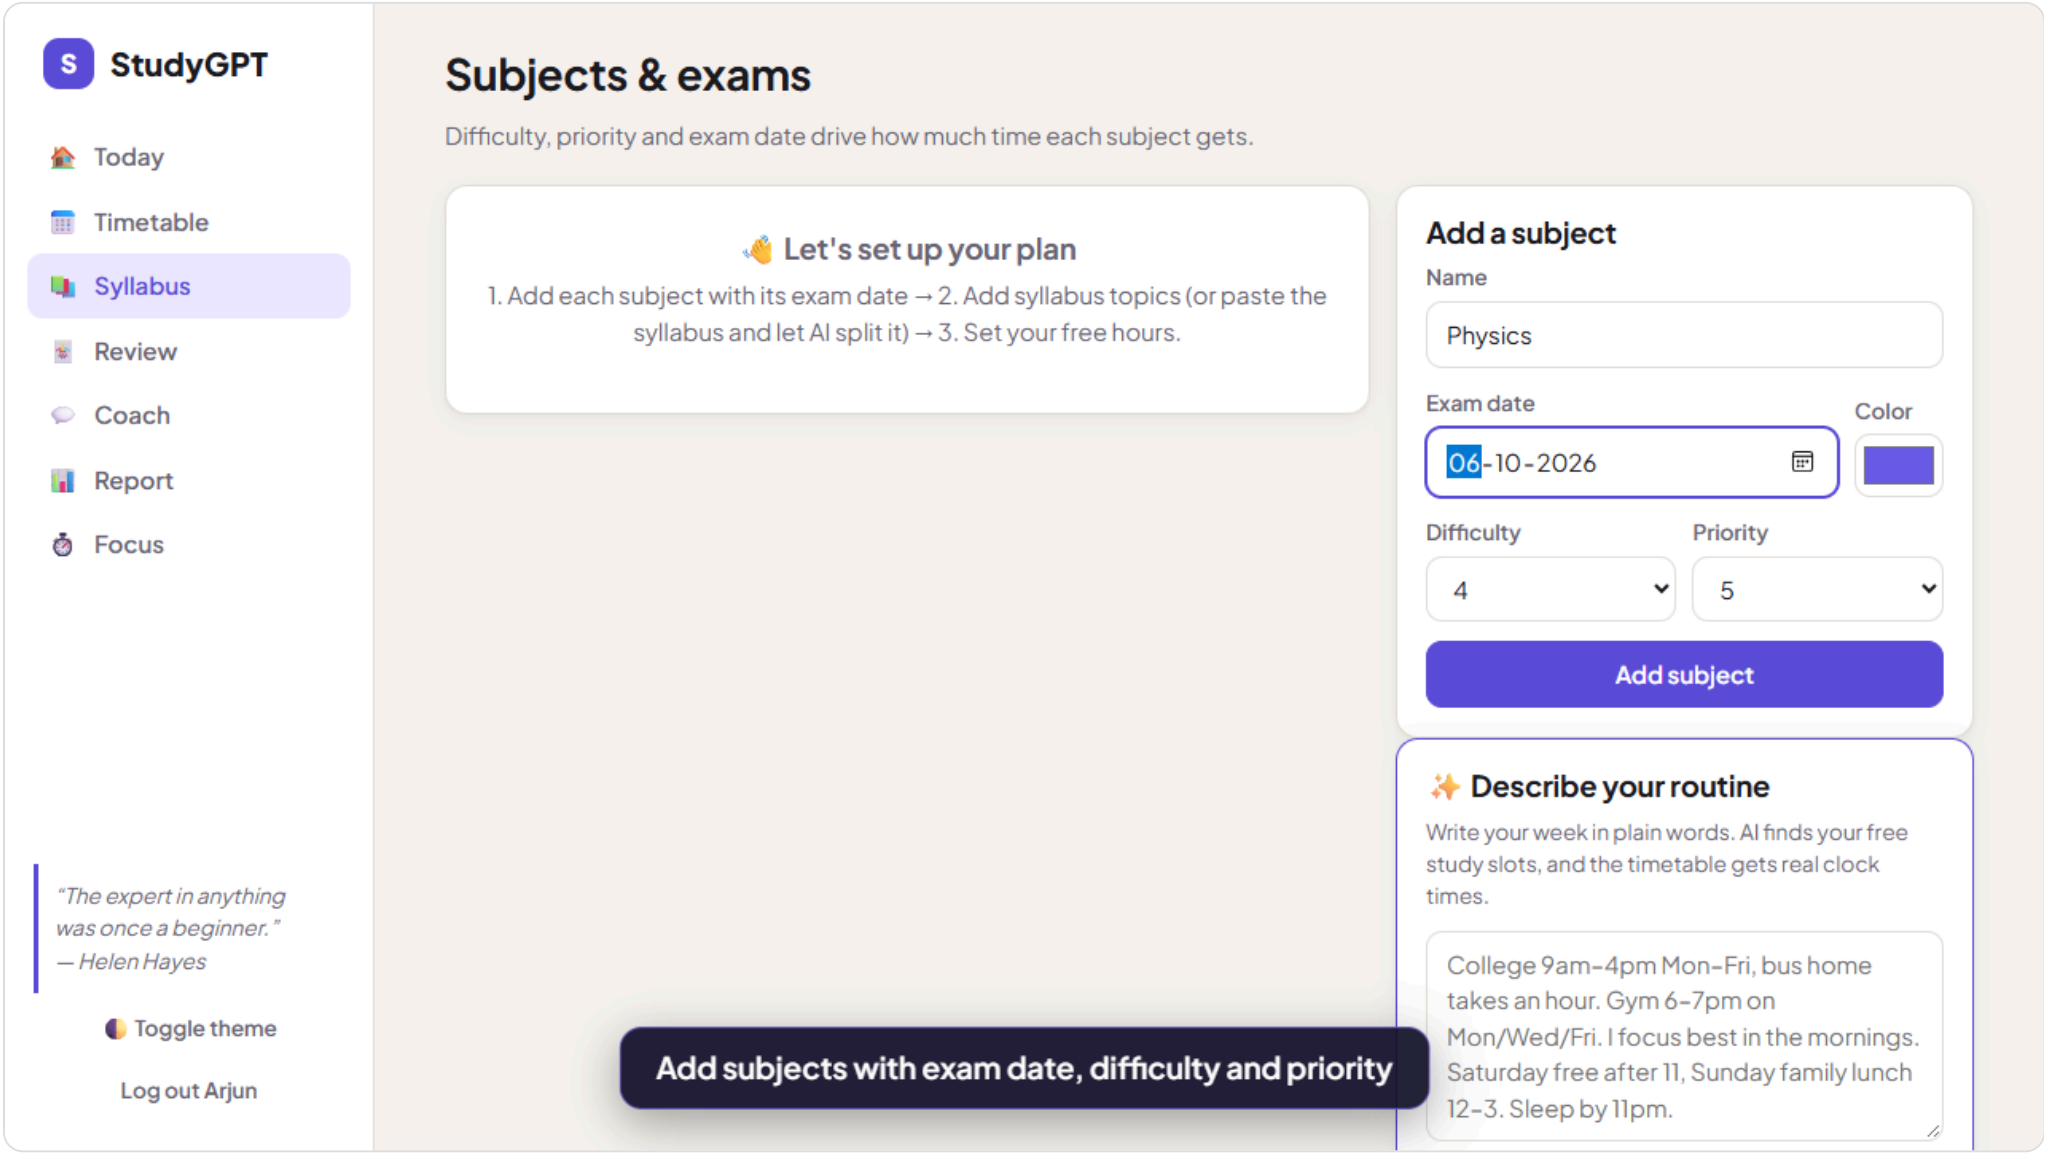

01 Sign up

Students create an account with a name, email and password.

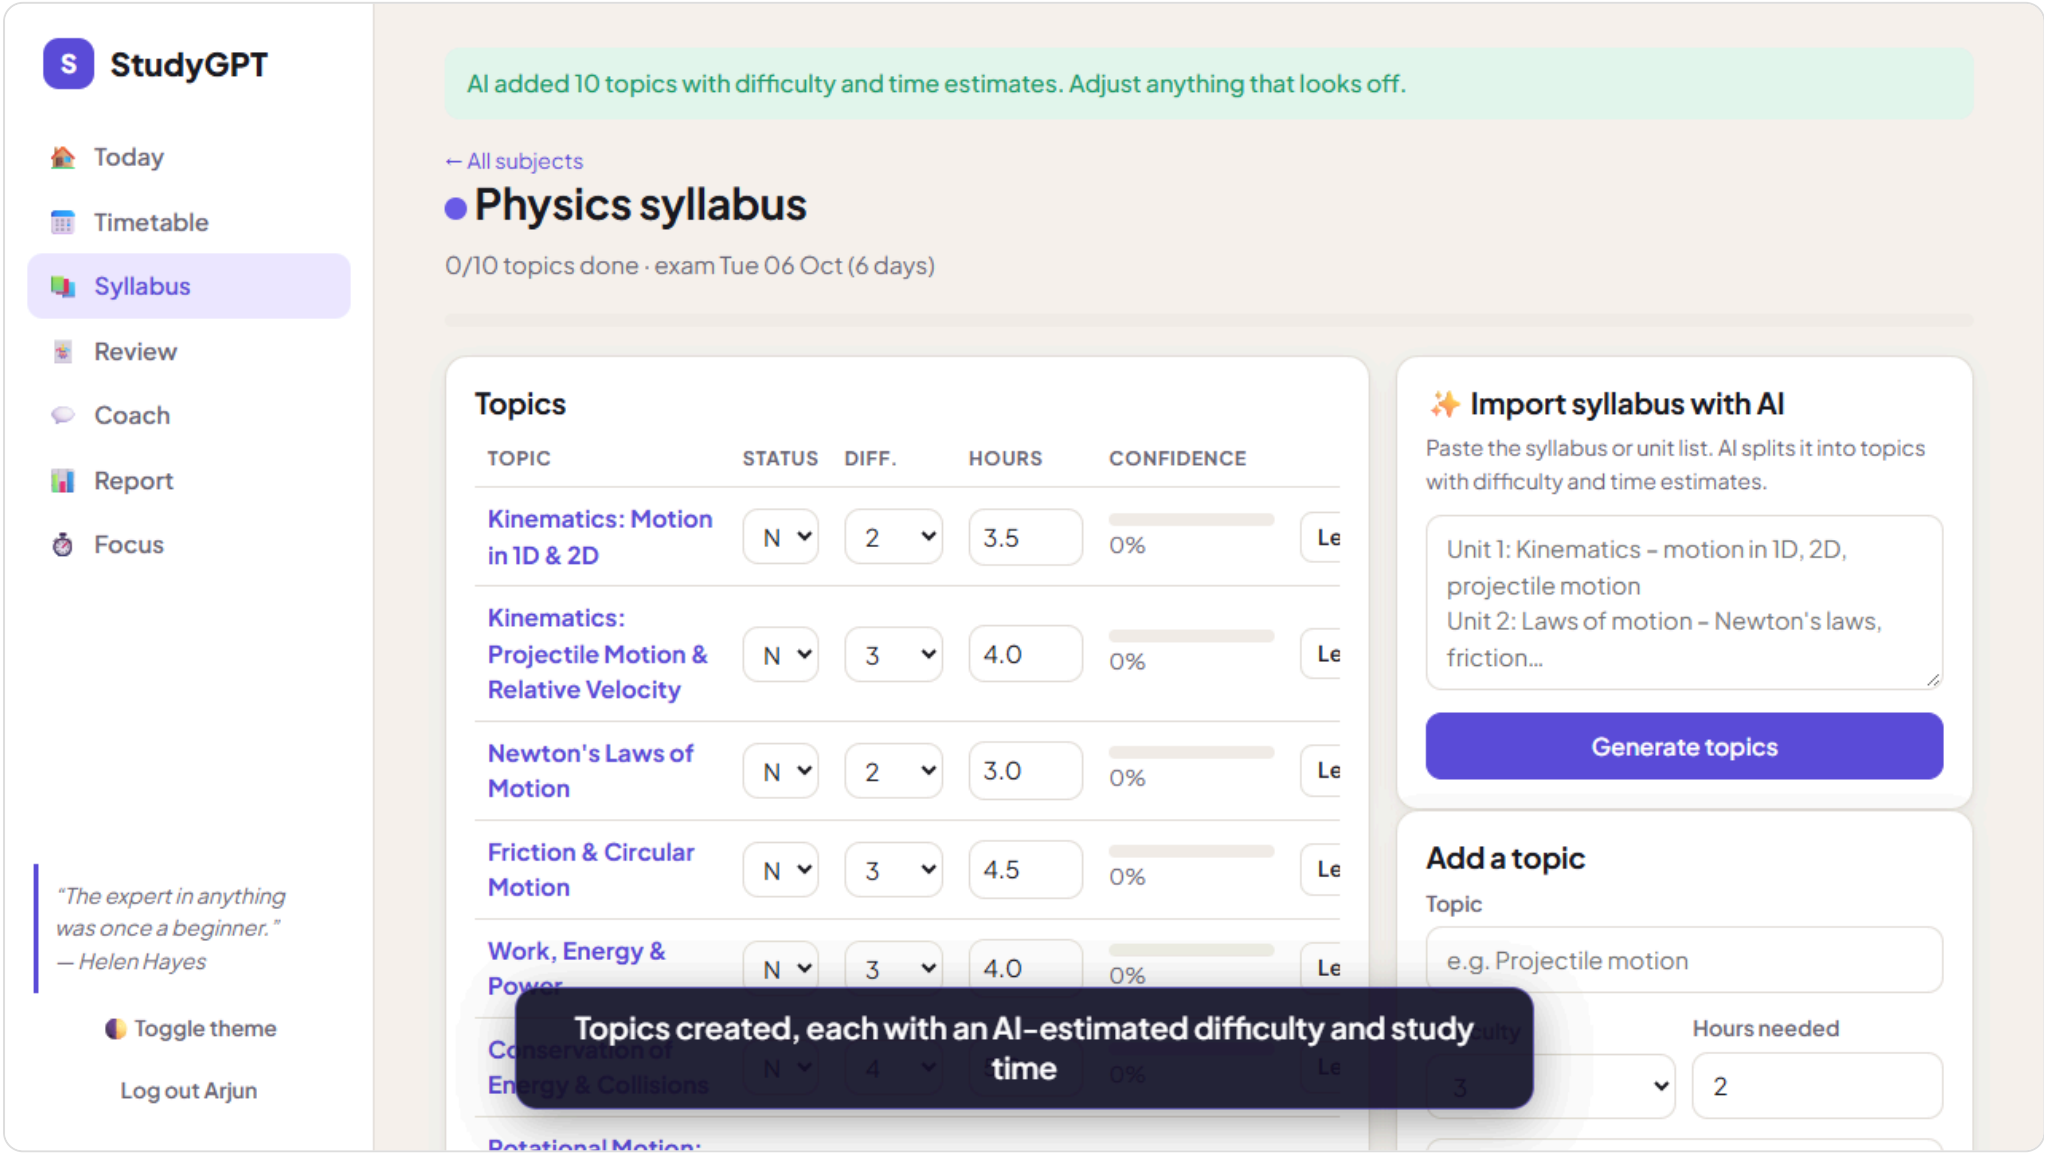

02 Subjects, exam dates, difficulty and priority

Each subject gets an exam date, a difficulty (1-5) and a priority (1-5). These feed directly into the scheduler.

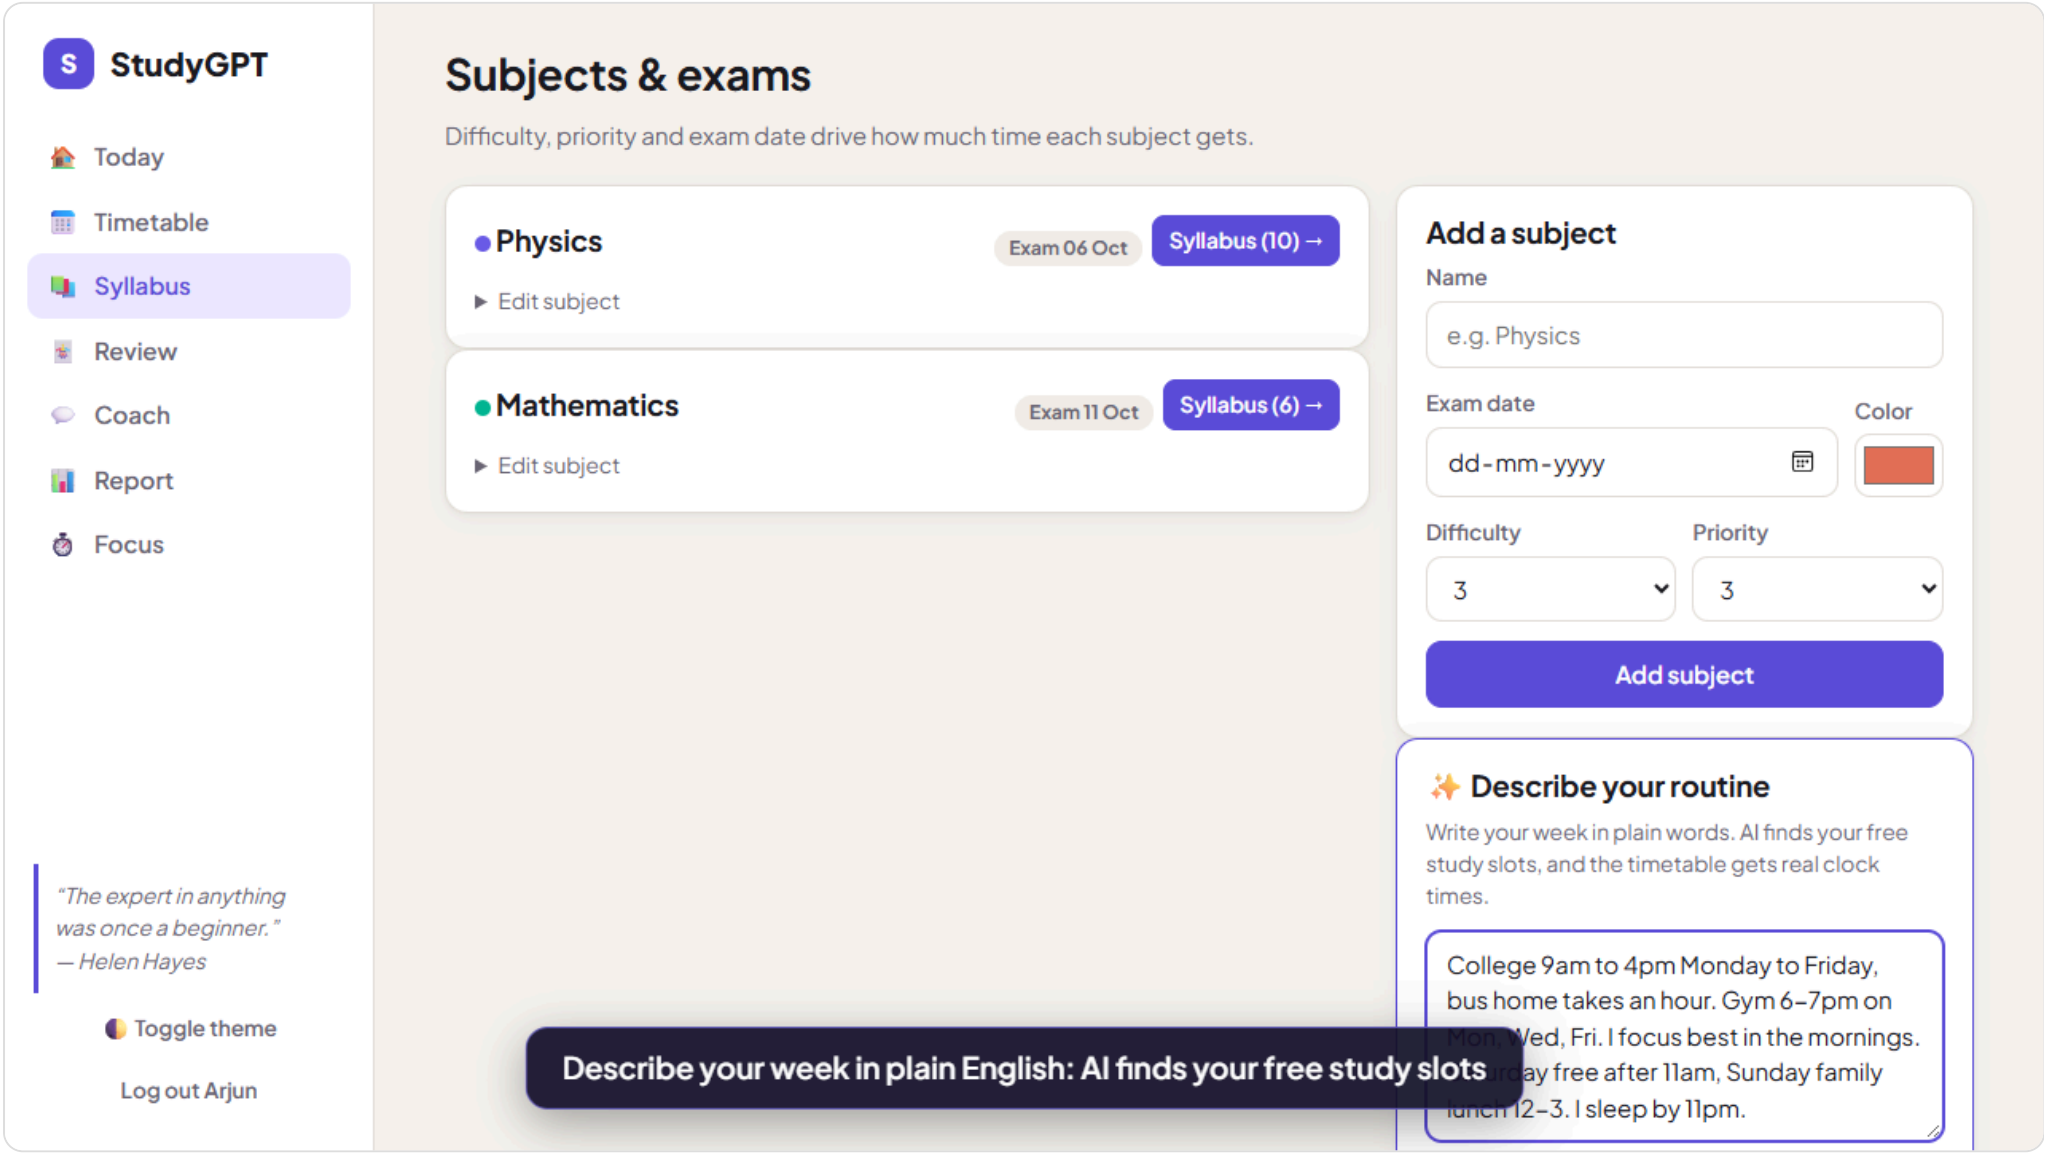

03 AI syllabus import and syllabus tracker

Paste the syllabus and the AI splits it into study topics, each with a difficulty and an estimated number of hours. Status and confidence are tracked per topic.

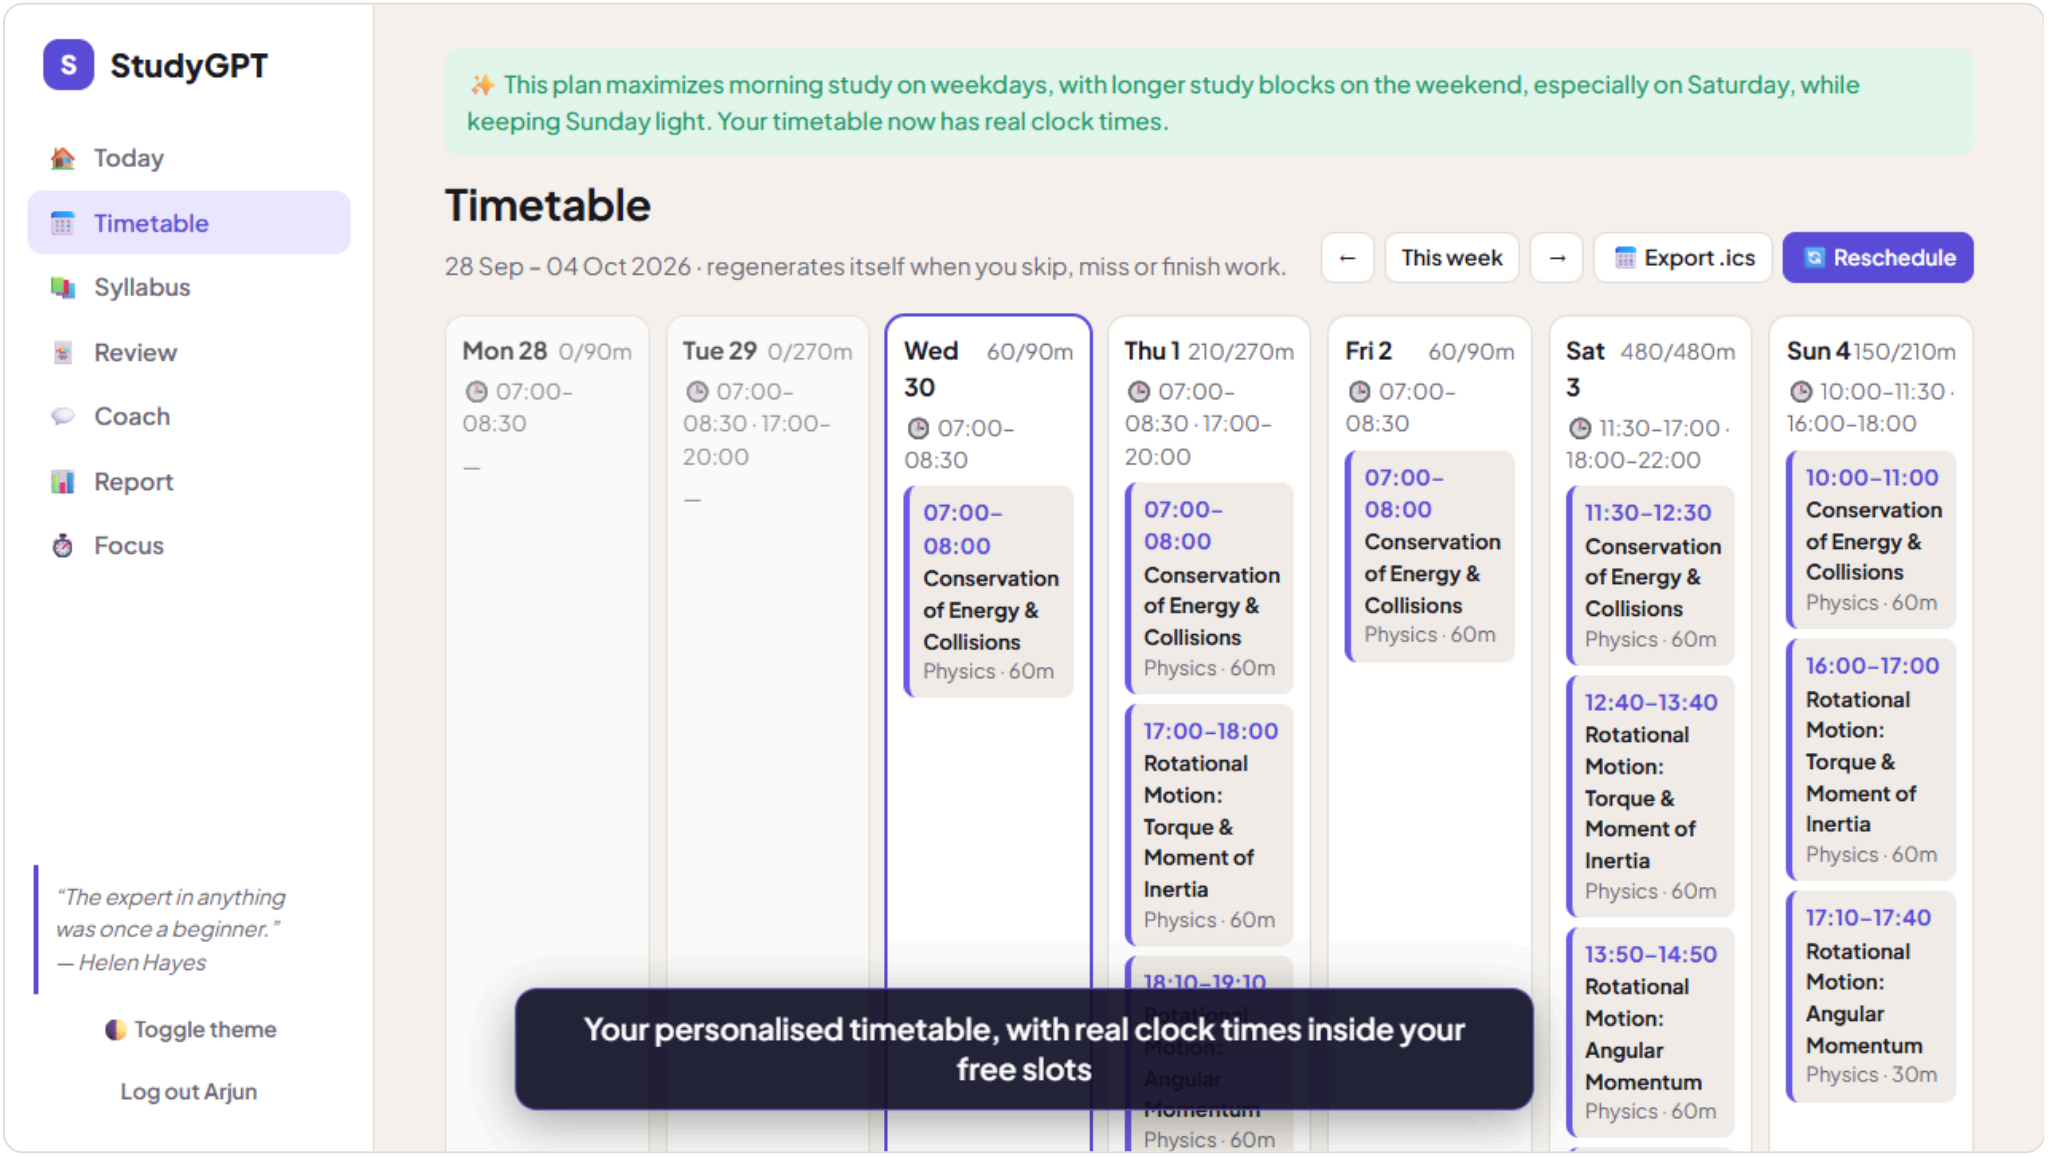

04 Describe your routine in plain English

The AI reads the student's weekly routine (classes, commute, gym, sleep, preferences) and works out their free study windows for every day.

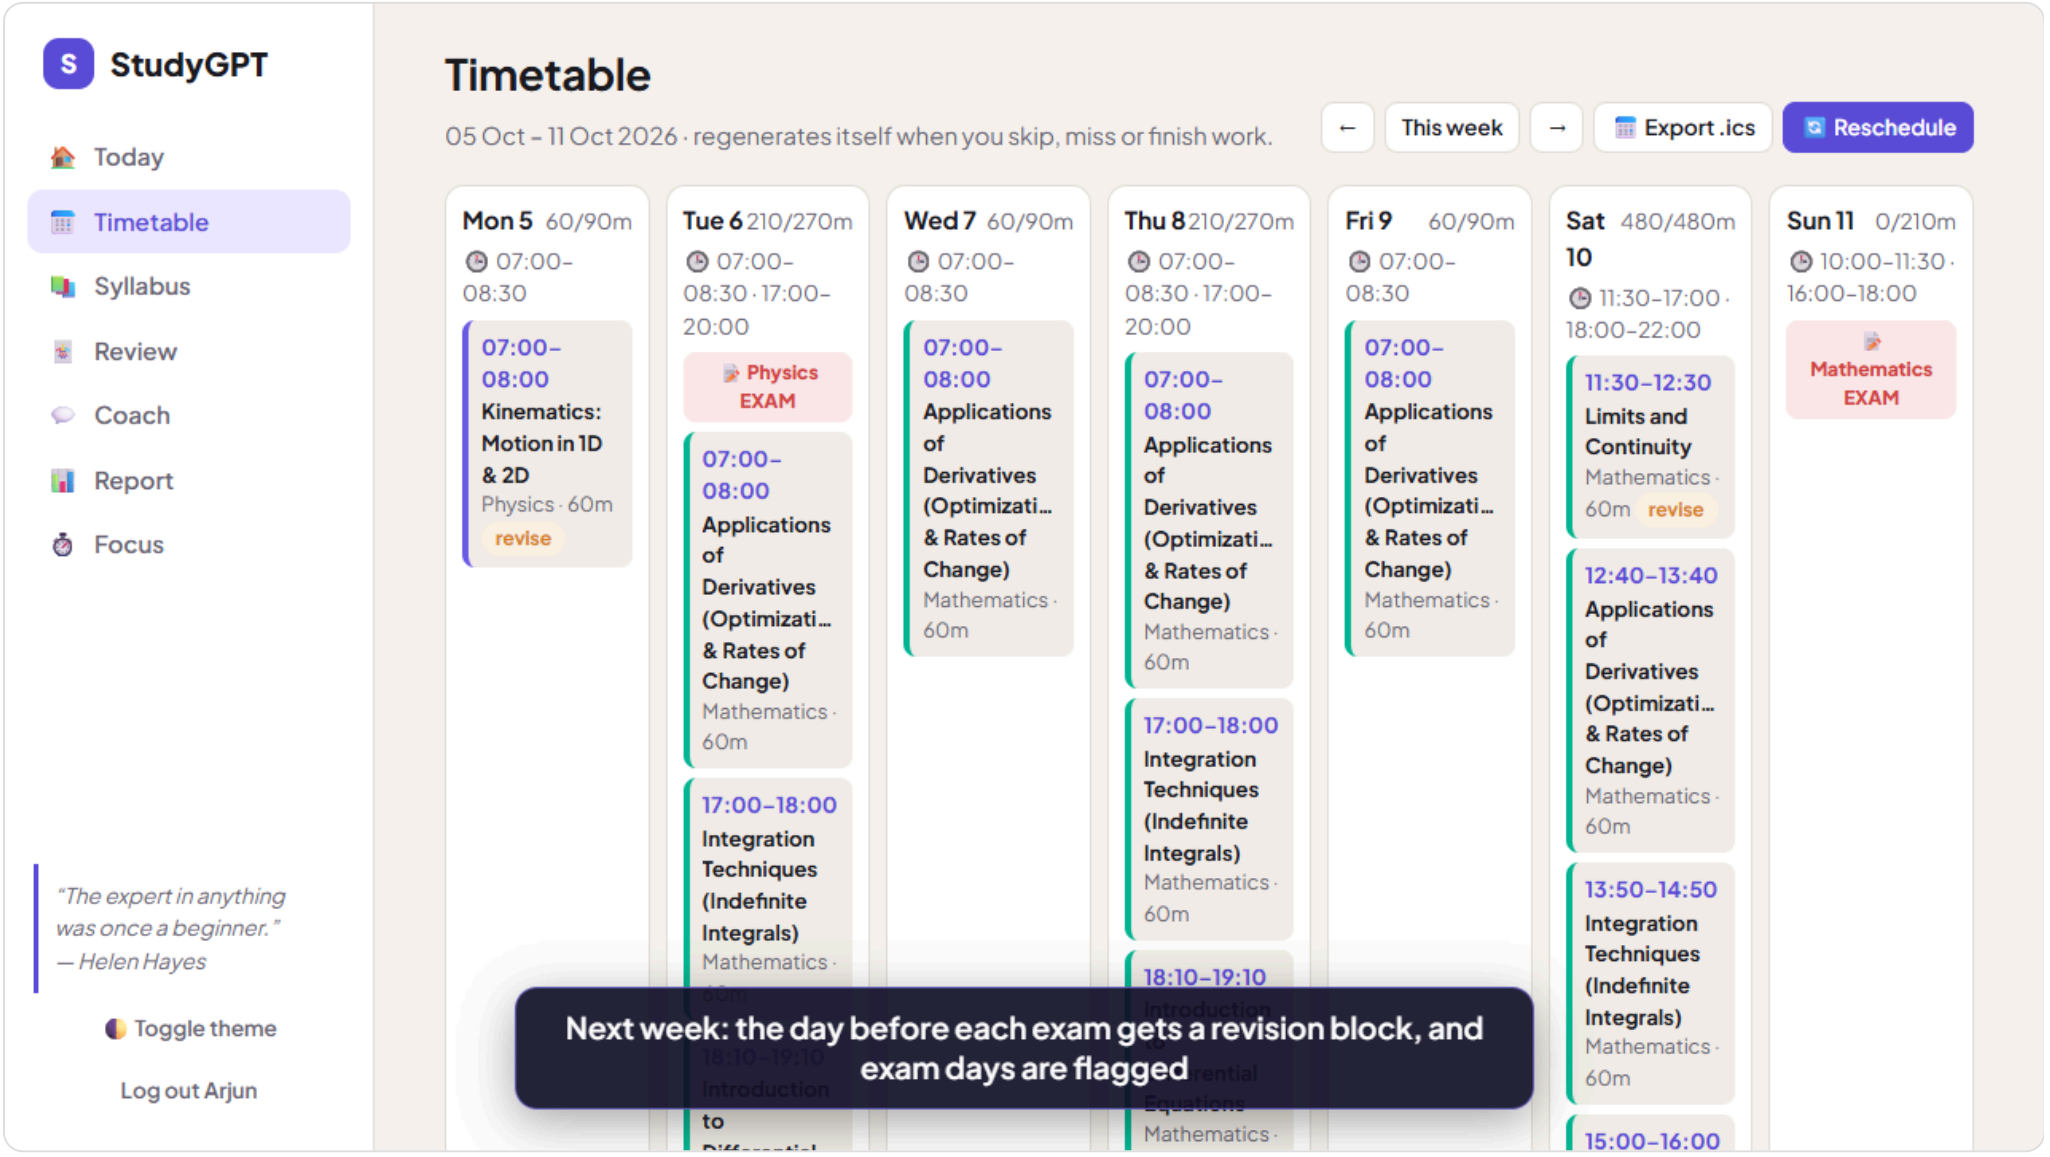

05 Personalised timetable

The scheduler fills each free window with 30-60 minute blocks, putting urgent, difficult and low-confidence topics first and interleaving subjects. Every session has a real start and end time.

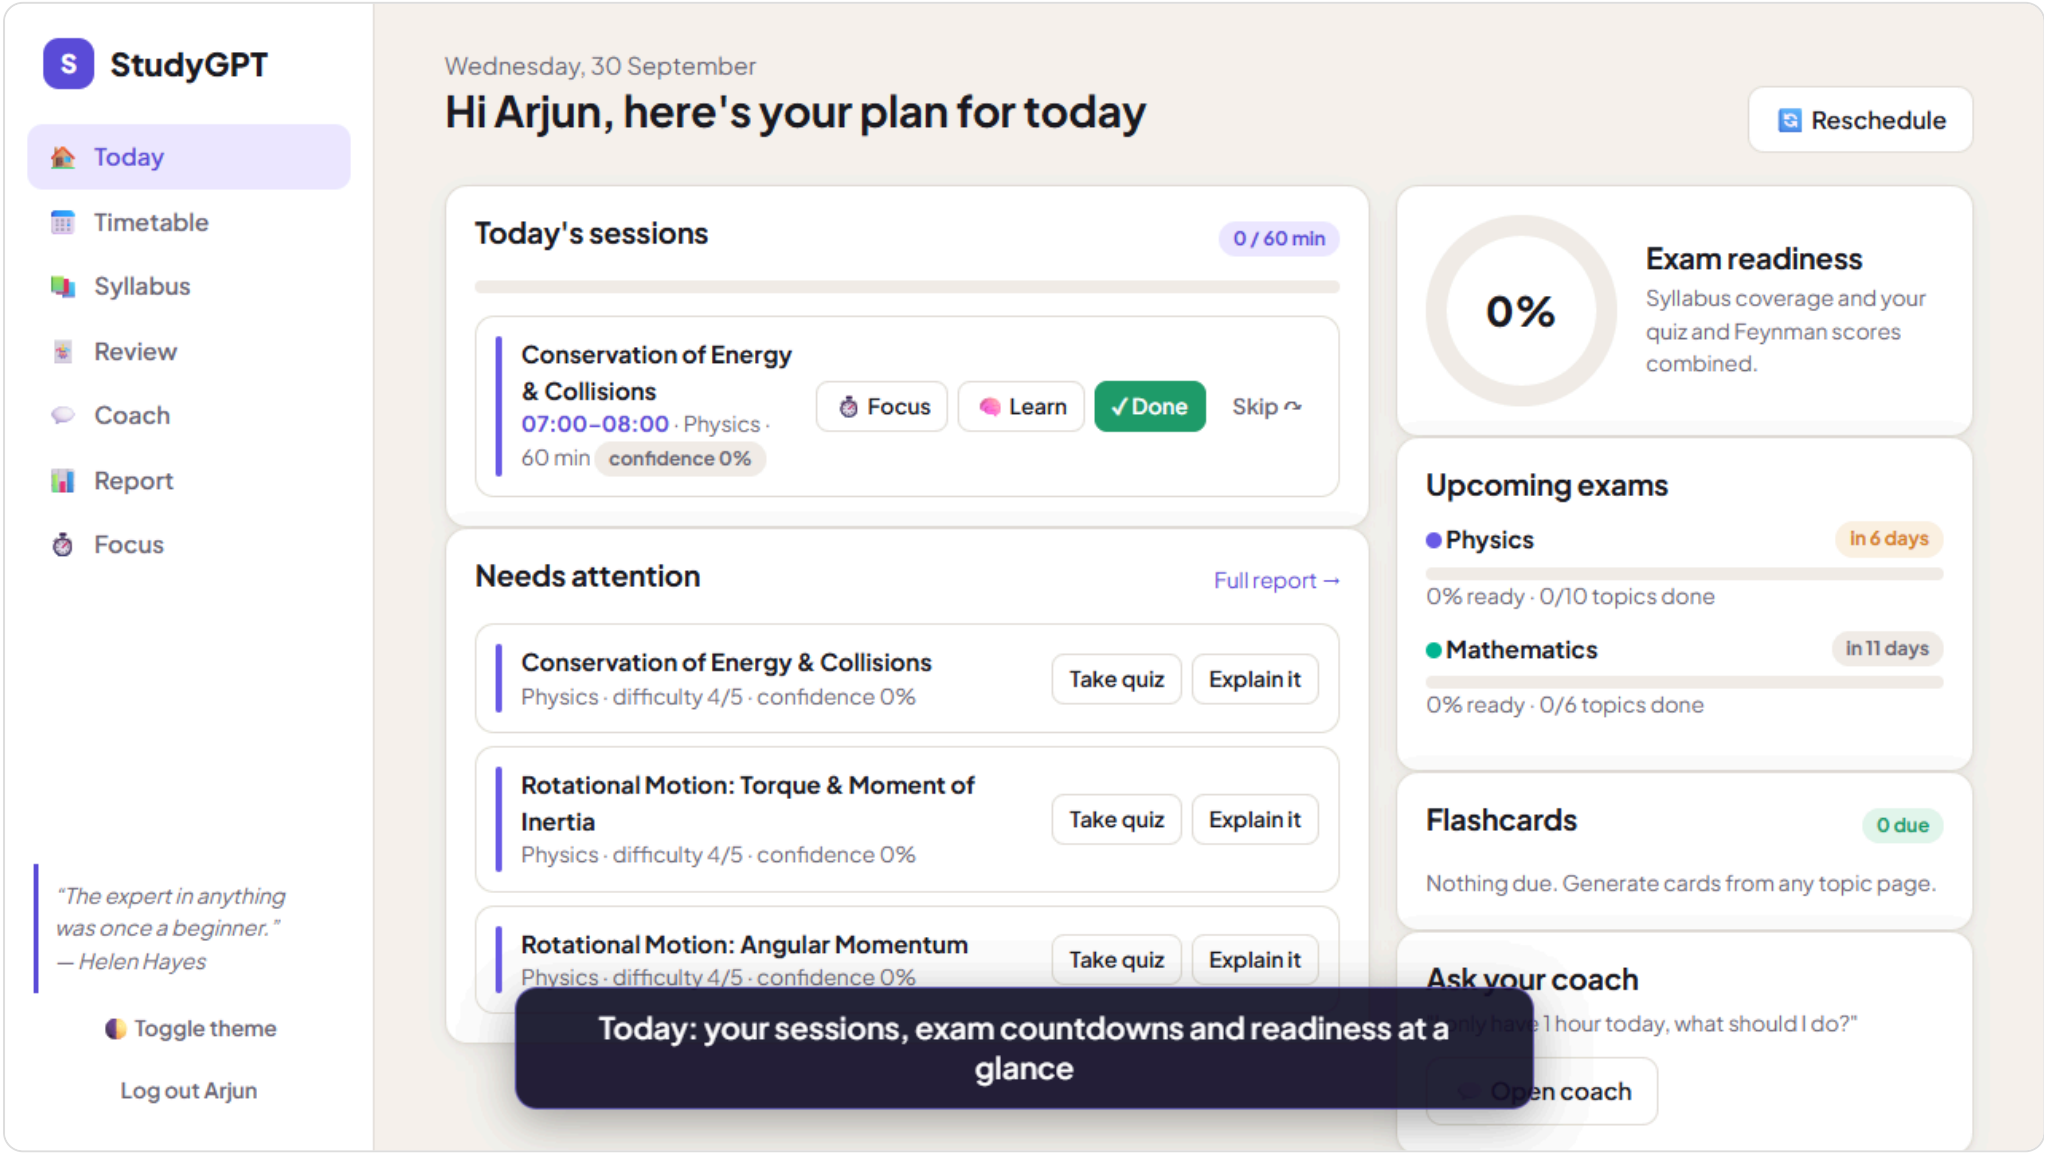

06 Exam-eve revision

The day before each exam gets a revision block on that subject's weakest topic. Nothing is scheduled for a subject on or after its exam day.

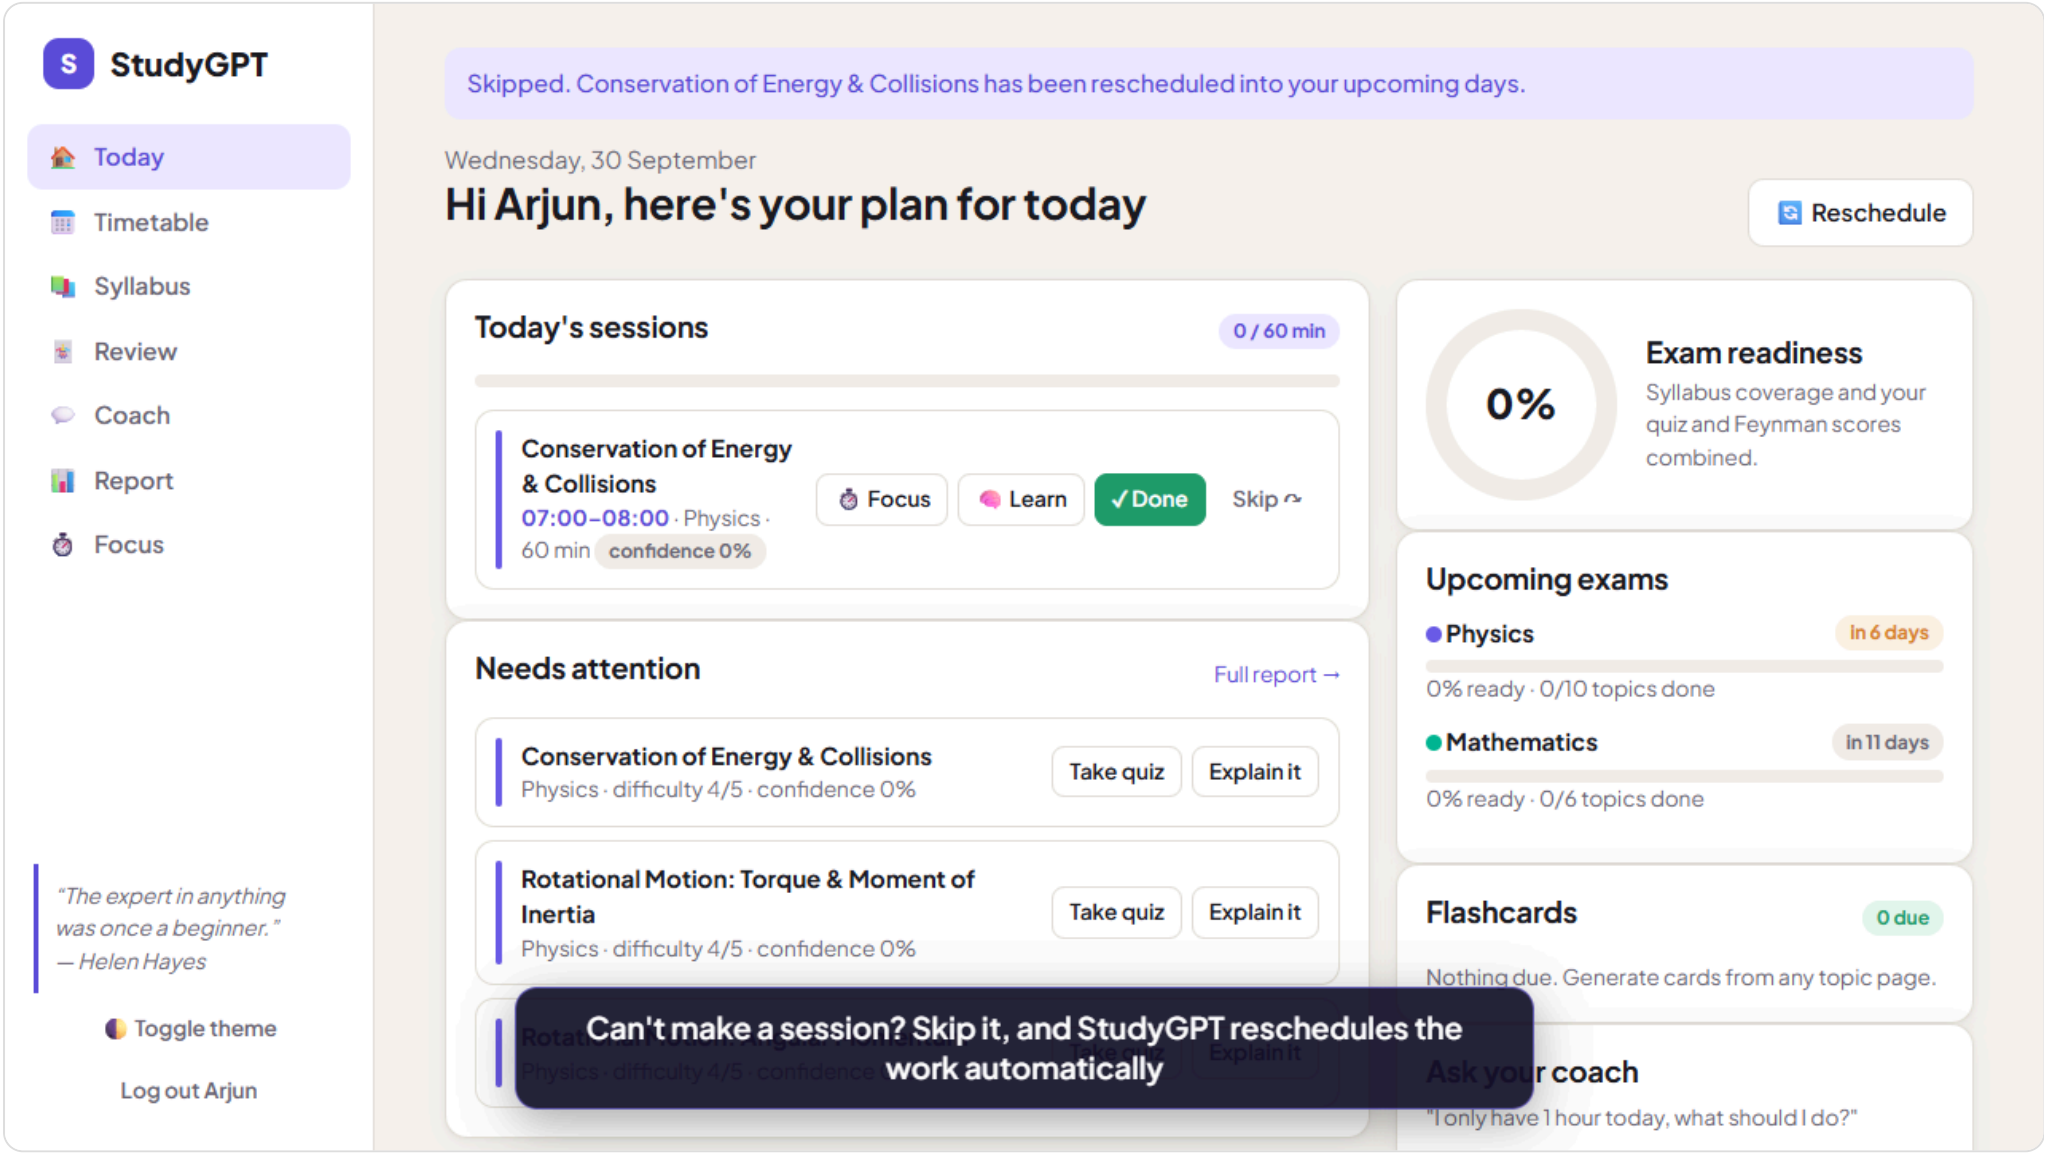

07 Today dashboard

Today's timed sessions with Focus, Learn, Done and Skip actions, plus exam readiness, exam countdowns, due flashcards and weak topics.

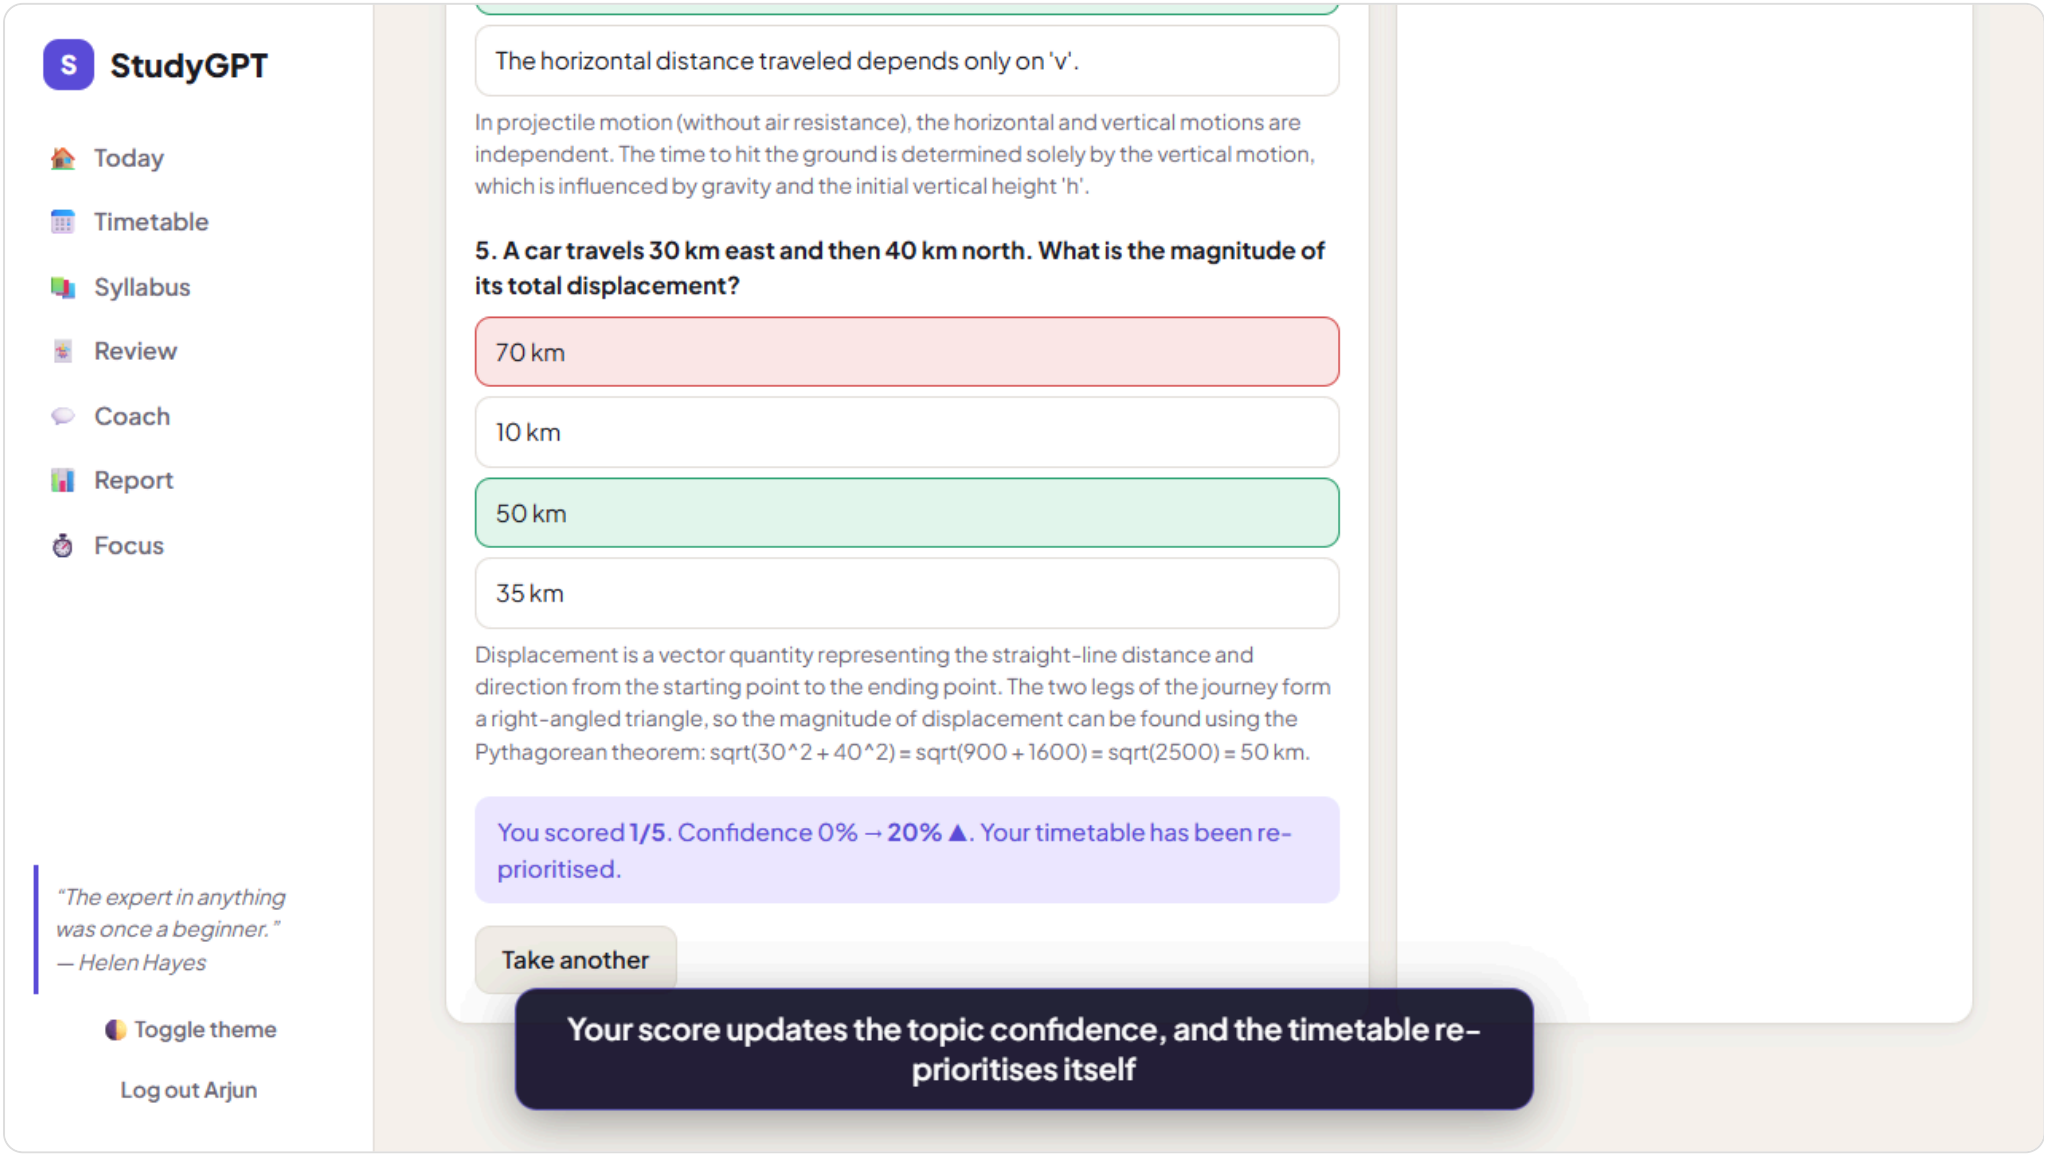

08 Automatic rescheduling

Skipping or missing a session marks it missed and regenerates the plan from today, so the work moves into upcoming free slots automatically.

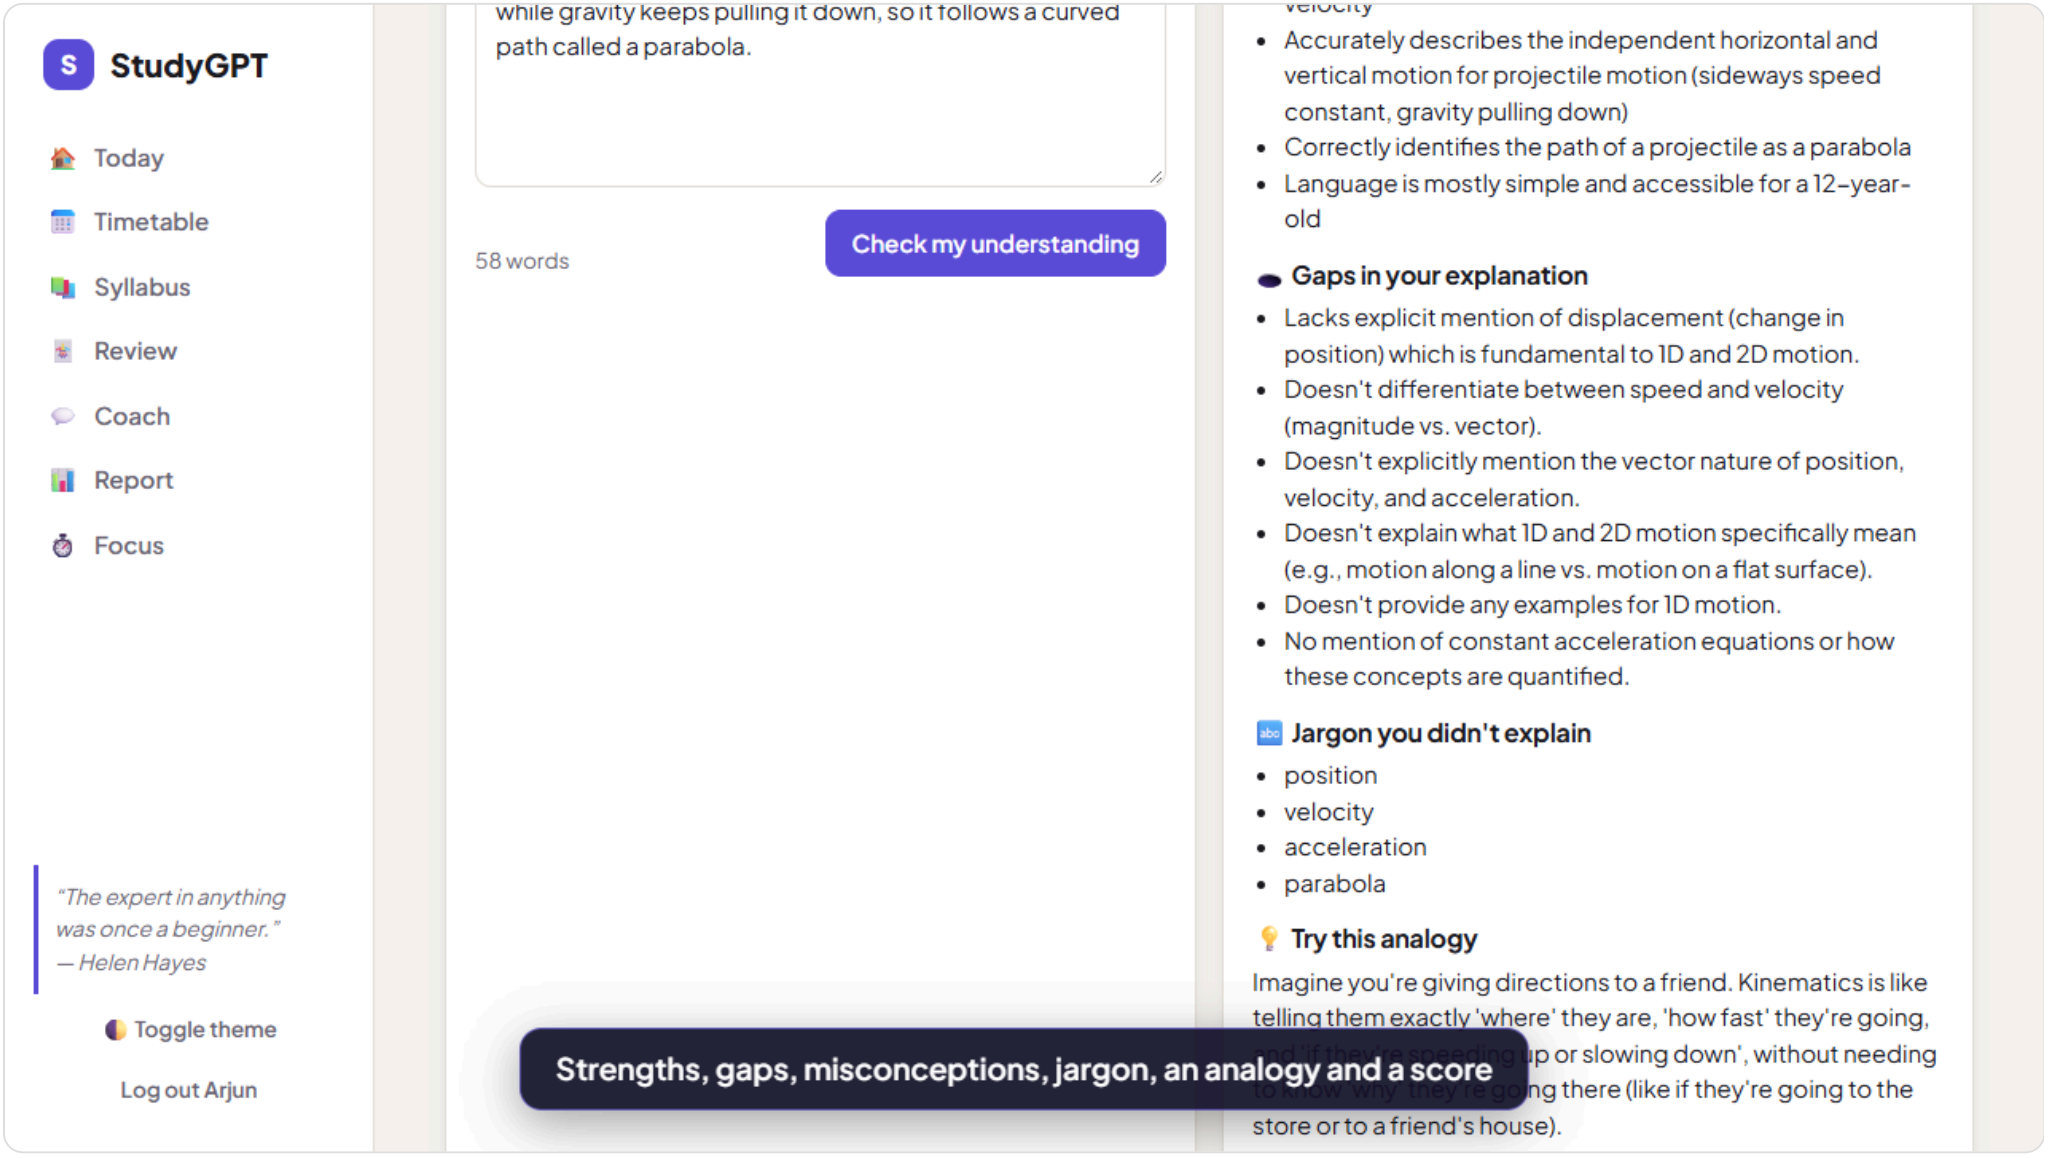

09 AI quiz generator

Five AI-written multiple-choice questions per topic, with explanations. The score updates the topic's confidence, which re-prioritises the timetable.

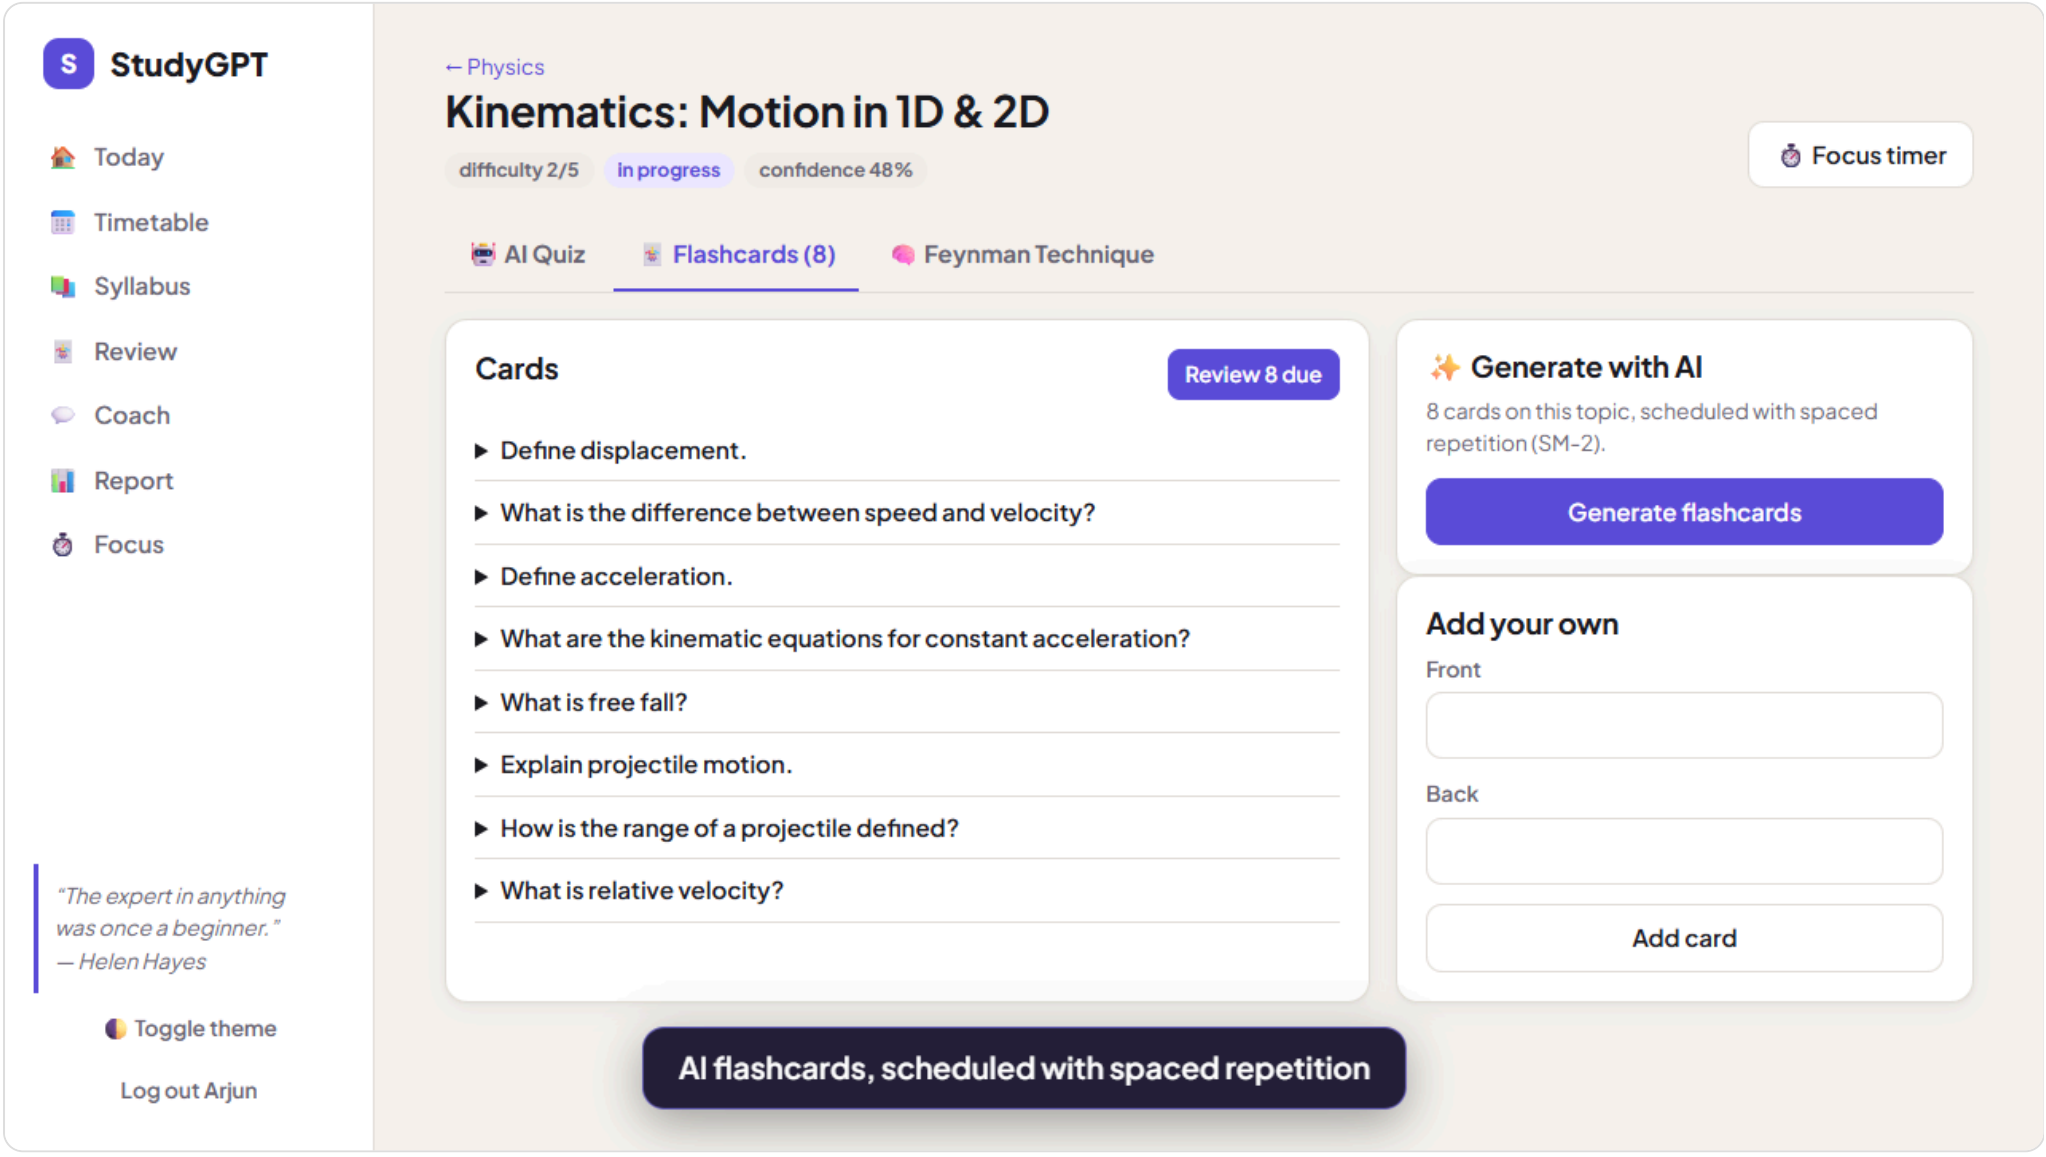

10 Feynman Technique

The student explains the topic in simple words. The AI returns strengths, gaps, misconceptions, unexplained jargon, a helpful analogy and a score.

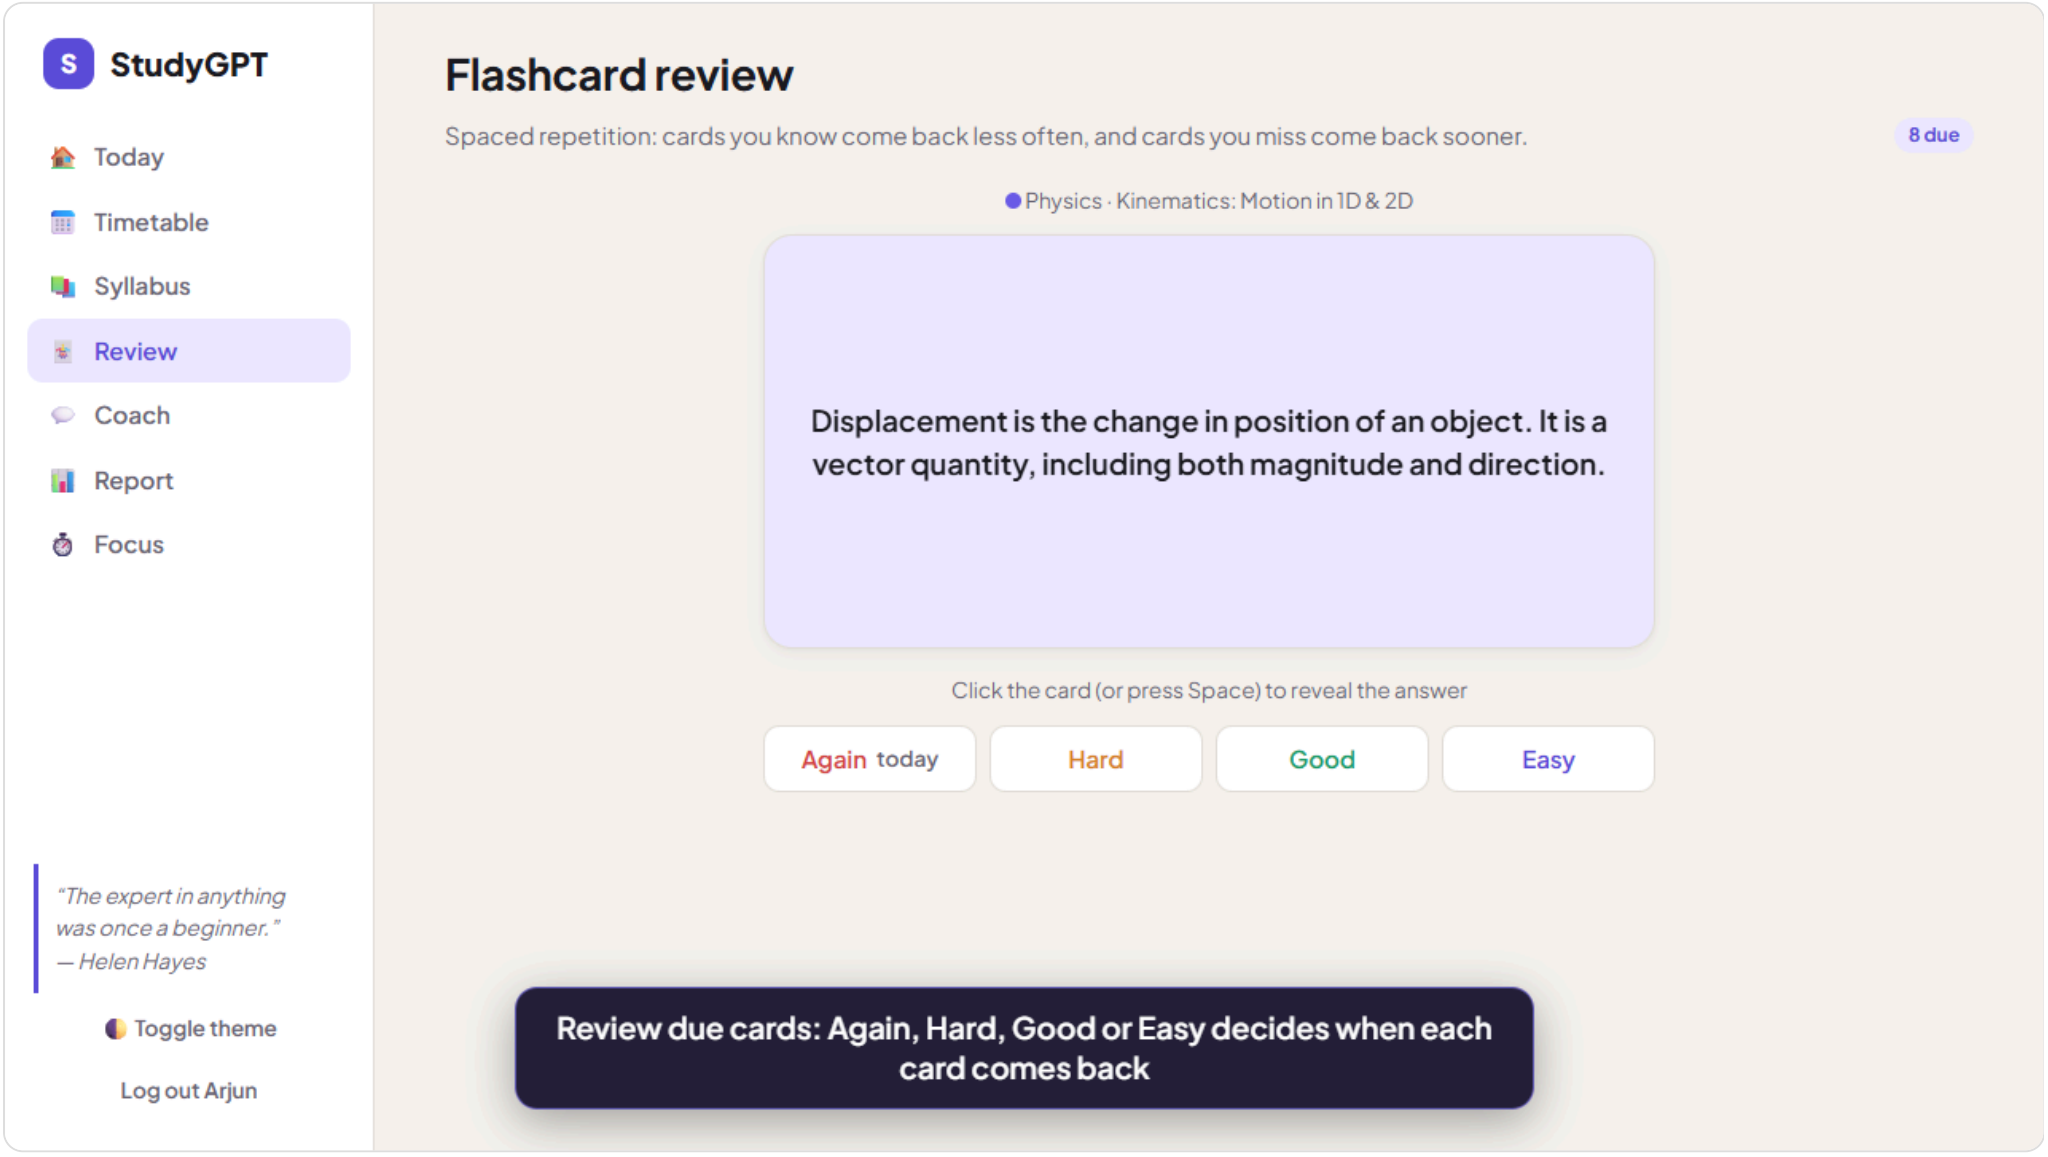

11 AI flashcards

Generate a set of flashcards for any topic, or write your own. Every card is scheduled with the SM-2 spaced repetition algorithm.

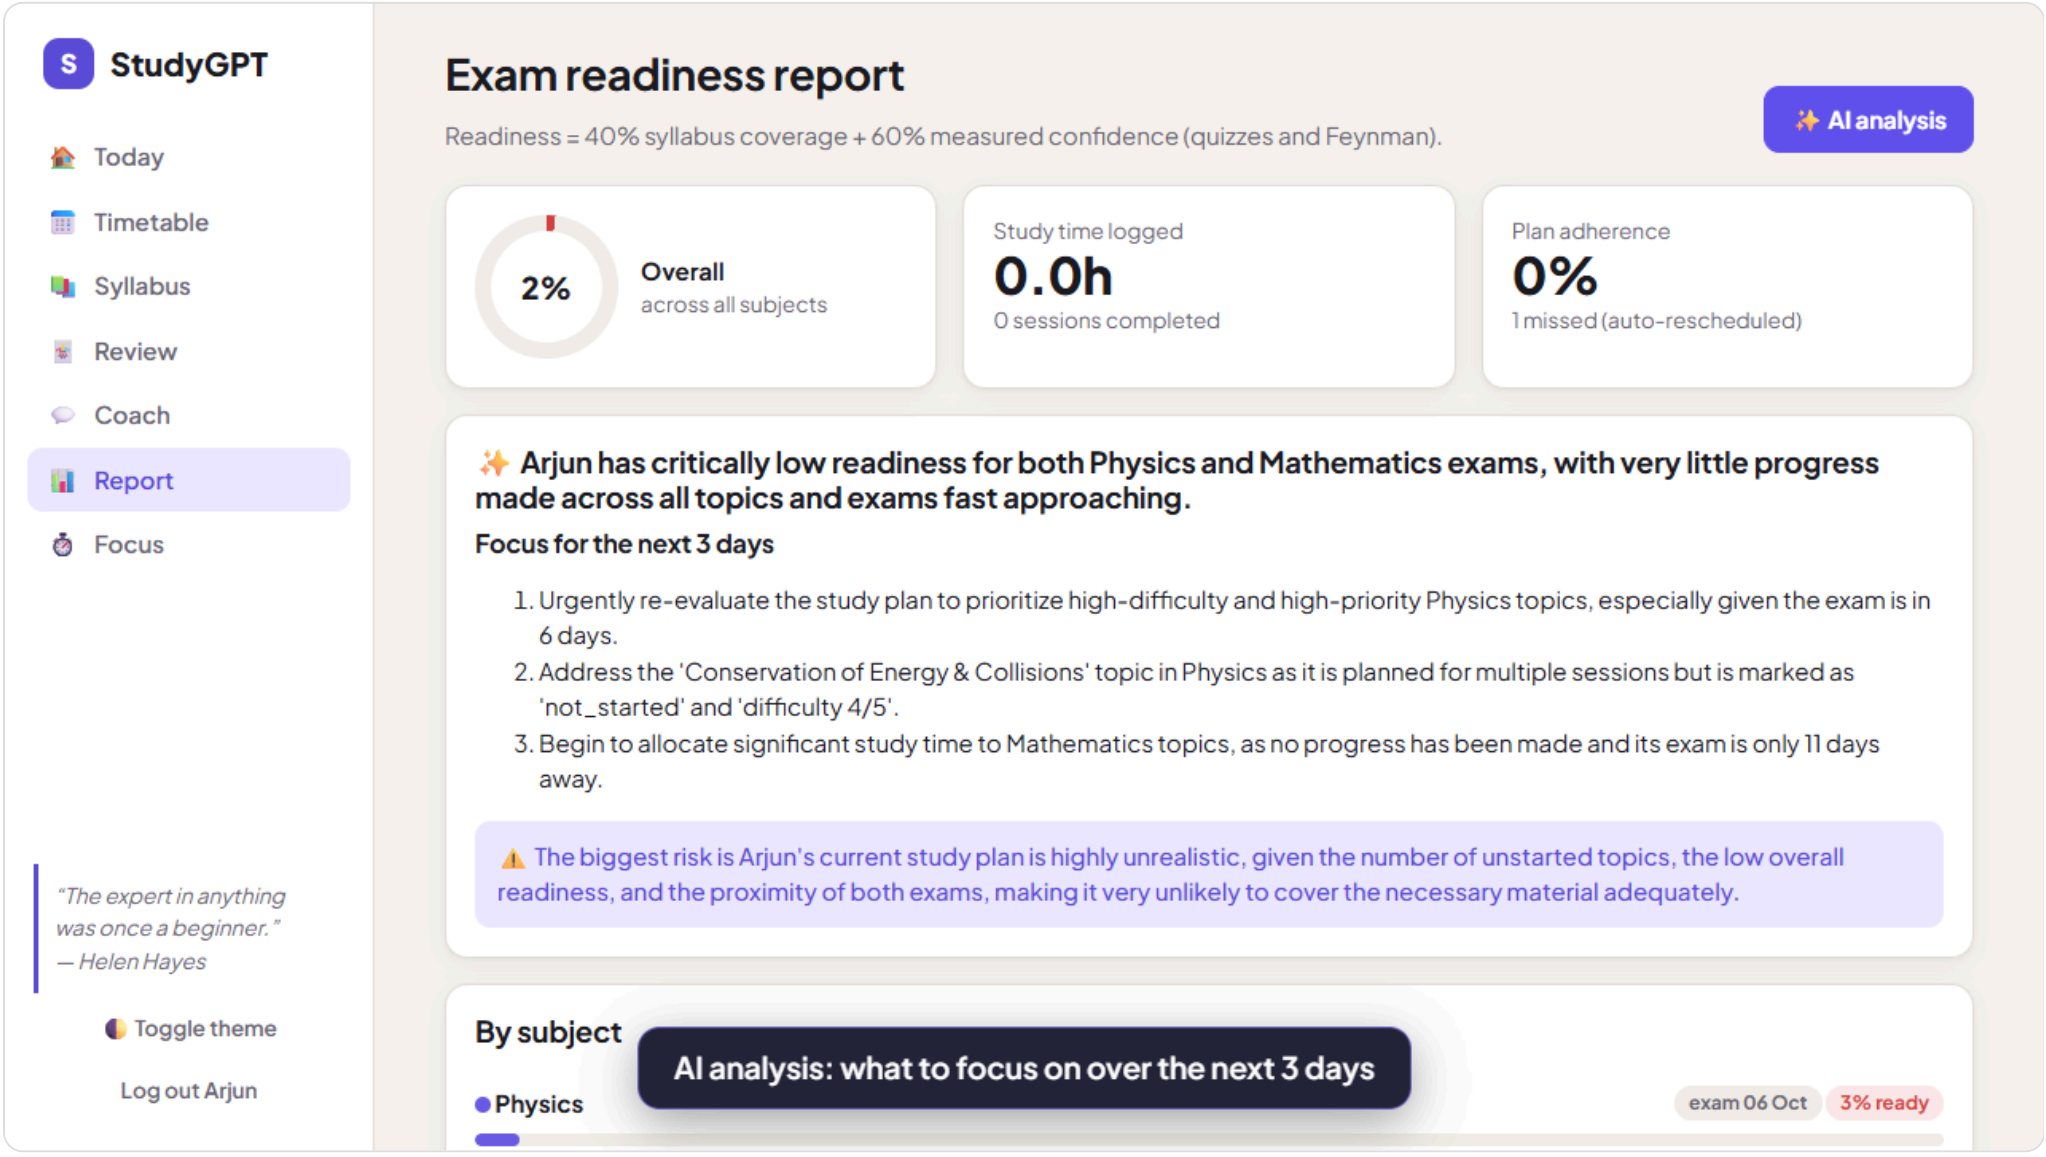

12 Spaced repetition review

Flip a card, then grade it Again, Hard, Good or Easy. SM-2 decides when the card comes back: known cards less often, missed cards sooner.

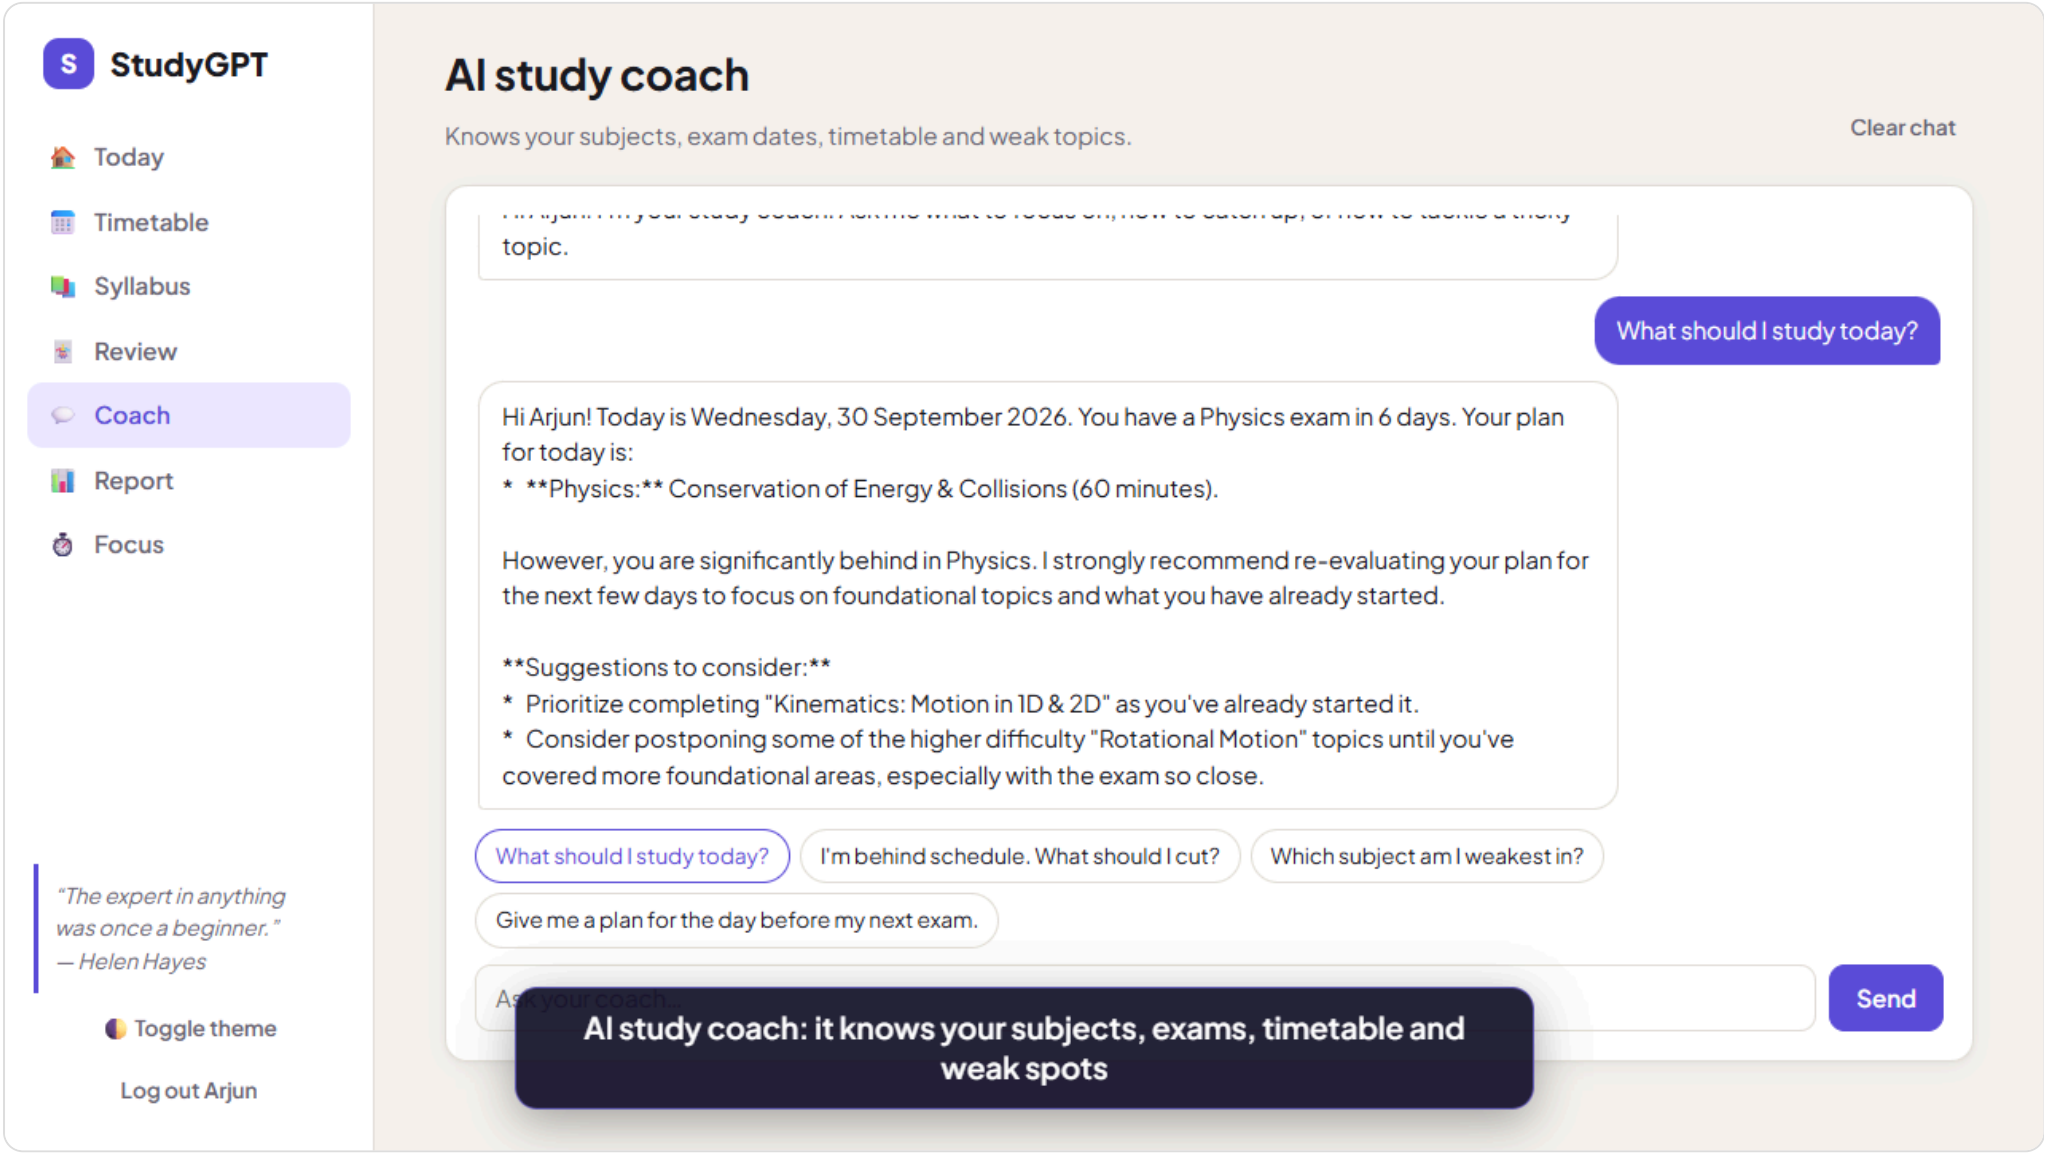

13 Exam readiness report

Readiness per subject (40% syllabus coverage + 60% measured confidence), hours studied, plan adherence, and an AI analysis of what to focus on next.

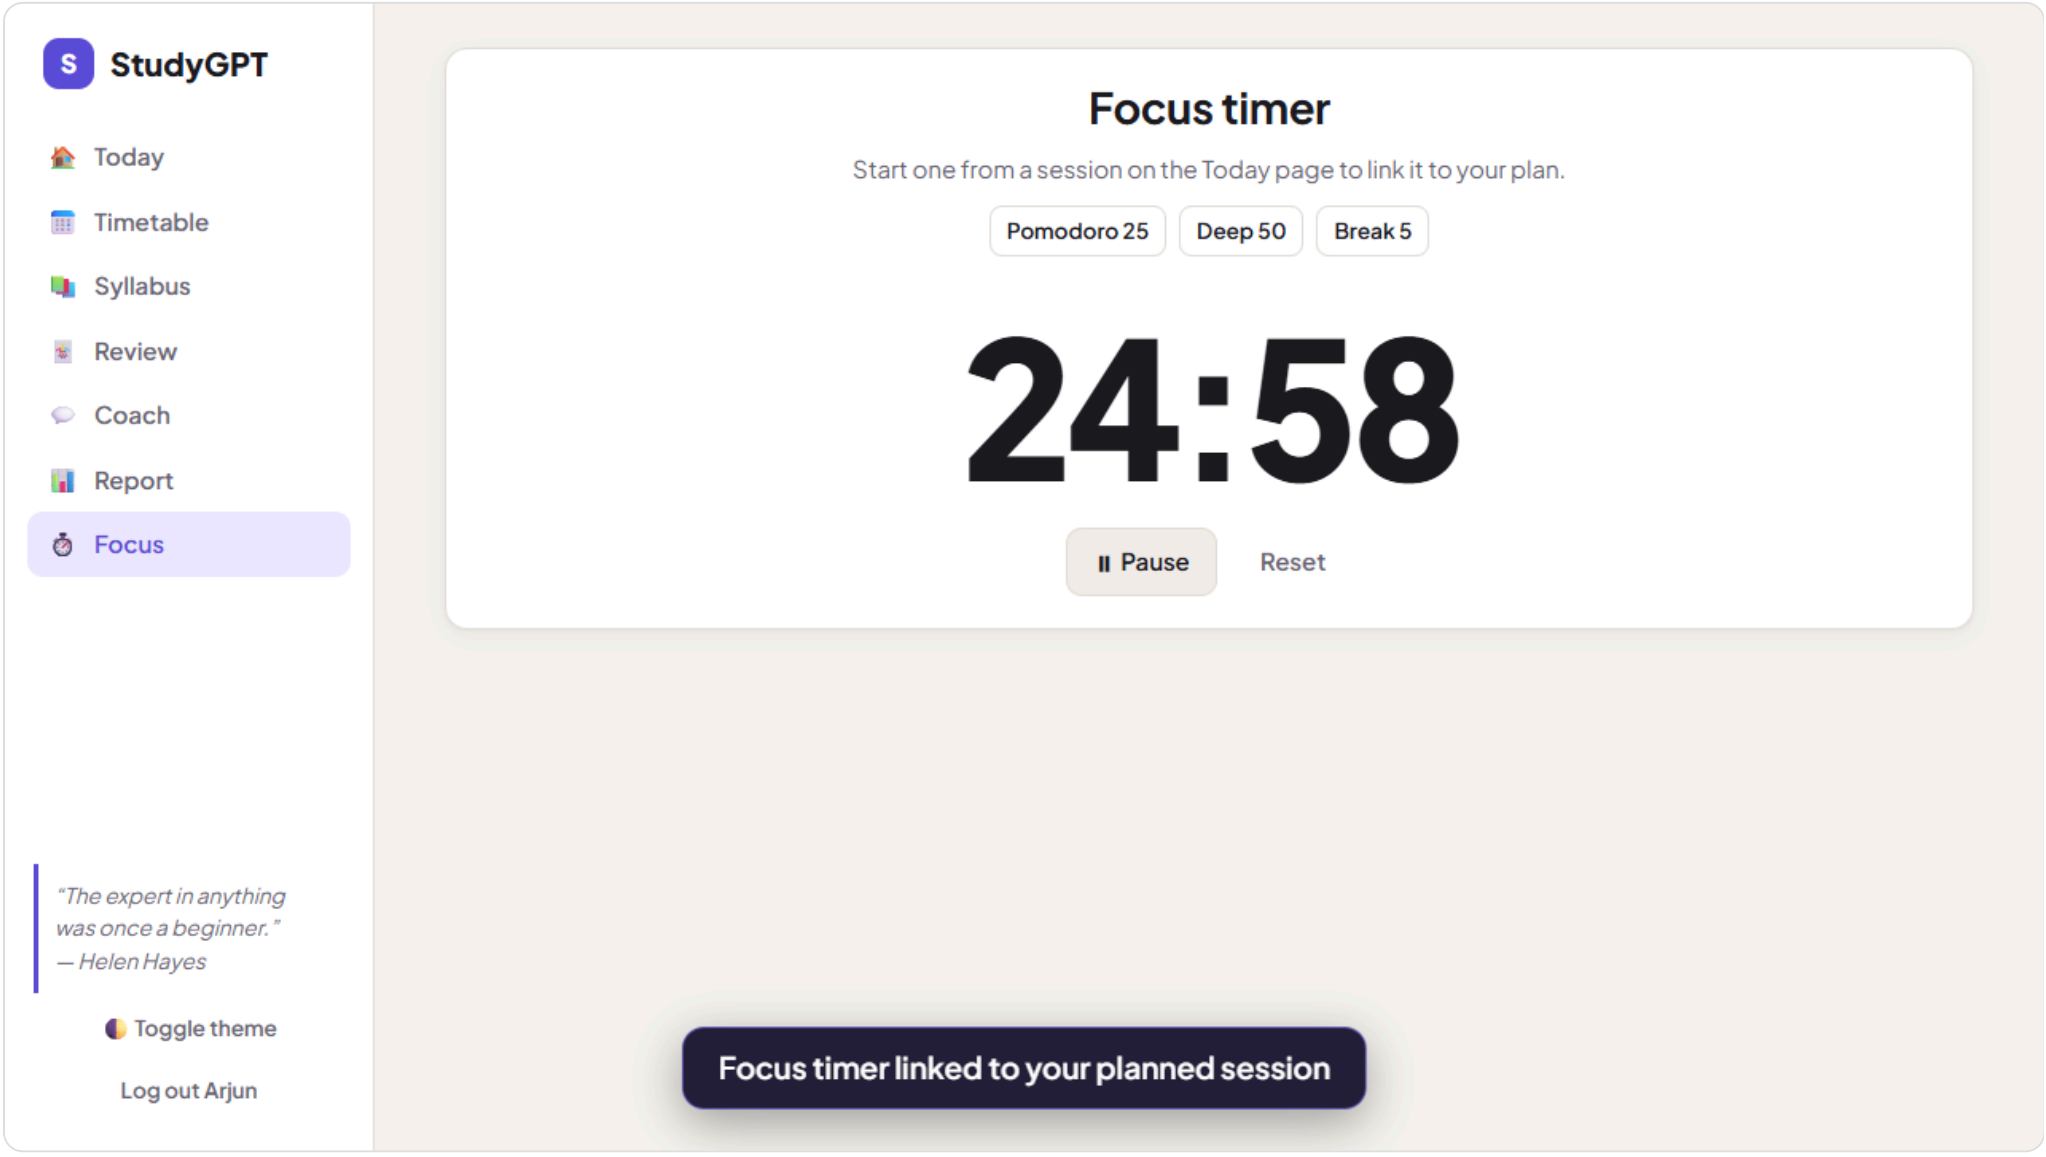

14 AI study coach

A chatbot that sees the student's real subjects, exam dates, timetable and weak topics, and gives specific advice.

15 Focus timer

A Pomodoro / deep-work timer linked to the planned session. It keeps running across page reloads.

16 Light and dark themes

Light and dark themes, a daily motivational quote, and a mobile layout with bottom navigation.
